

Towards a Resource-Index of Nations

Prof. Arnold Tukker, CML, Leiden University and TNO
Special WRF session, ISIE Conference, 6 July 2015

Universiteit Leiden
The Netherlands

Introduction

- Some backgrounds
- Approaches for data mining / inventory and other points of departure
- Economic or 'reference' indicator
- Indicators by resource category
 - Water
 - Land
 - Materials
 - Carbon??
- Integration

Some backgrounds

- Series of EU projects constructing EXIOBASE
- Calculating resource footprints per capita per country
- Question: can't we aggregate this to ONE resource footprint as counterpart to GDP?

		Industries				$Y_{\cdot,A}$	$Y_{\cdot,B}$	$Y_{\cdot,C}$	$Y_{\cdot,D}$	q
Products	$Z_{A,A}$	$Z_{A,B}$	$Z_{A,C}$	$Z_{A,D}$	$Y_{A,A}$	$Y_{A,B}$	$Y_{A,C}$	$Y_{A,D}$	q_A	
	$Z_{B,A}$	$Z_{B,B}$	$Z_{B,C}$	$Z_{B,D}$	$Y_{B,A}$	$Y_{B,B}$	$Y_{B,C}$	$Y_{B,D}$	q_B	
	$Z_{C,A}$	$Z_{C,B}$	$Z_{C,C}$	$Z_{C,D}$	$Y_{C,A}$	$Y_{C,B}$	$Y_{C,C}$	$Y_{C,D}$	q_C	
	$Z_{D,A}$	$Z_{D,B}$	$Z_{D,C}$	$Z_{D,D}$	$Y_{D,A}$	$Y_{D,B}$	$Y_{D,C}$	$Y_{D,D}$	q_D	
W	W_A	W_B	W_C	W_D						
g	g_A	g_B	g_C	g_D						
C & L	Capital _A	C_A	C_C	C_D						
	Labor _A	L_B	L_C	L_D						
Environ Ext	NAMEA _A	NAMEA _B	NAMEA _C	NAMEA _D						
	Agric _A	Agric _B	Agric _C	Agric _D						
	Energy _A	Energy _B	Energy _C	Energy _D						
	Metal _A	Metal _B	Metal _C	Metal _D						
	Mineral _A	Mineral _B	Mineral _C	Mineral _D						
	Land _A	Land _B	Land _C	Land _D						

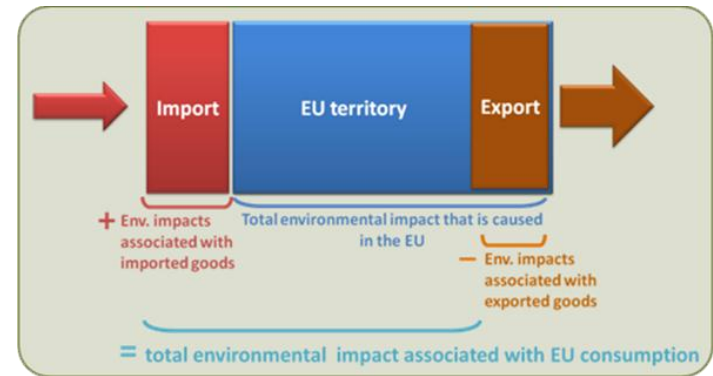

Some backgrounds: resource footprint p.c.

Approaches for data mining and other basics

- Consumption and production oriented
- Data mining; 2 accepted methods
 - Co-efficient approaches
 - MR EE IO approaches
- Should we include carbon footprint (=impact)?

		Industries				$Y_{i,A}$	$Y_{i,B}$	$Y_{i,C}$	$Y_{i,D}$	q
Products	$Z_{i,A}$	$Z_{i,B}$	$Z_{i,C}$	$Z_{i,D}$	$Y_{i,A}$	$Y_{i,B}$	$Y_{i,C}$	$Y_{i,D}$	q_i	
	$Z_{j,A}$	$Z_{j,B}$	$Z_{j,C}$	$Z_{j,D}$	$Y_{j,A}$	$Y_{j,B}$	$Y_{j,C}$	$Y_{j,D}$	q_j	
	$Z_{k,A}$	$Z_{k,B}$	$Z_{k,C}$	$Z_{k,D}$	$Y_{k,A}$	$Y_{k,B}$	$Y_{k,C}$	$Y_{k,D}$	q_k	
	$Z_{l,A}$	$Z_{l,B}$	$Z_{l,C}$	$Z_{l,D}$	$Y_{l,A}$	$Y_{l,B}$	$Y_{l,C}$	$Y_{l,D}$	q_l	
W	$W_{i,A}$	$W_{i,B}$	$W_{i,C}$	$W_{i,D}$						
	B_A	B_B	B_C	B_D						
C, B, L, F	Capital _i	C_i	C_i	C_i						
	Labor _i	L_i	L_i	L_i						
Environ. Eff.	NAMEA _i	NAMEA _B	NAMEA _C	NAMEA _D						
	Agric _i	Agric _B	Agric _C	Agric _D						
	Energy _i	Energy _B	Energy _C	Energy _D						
	Metal _i	Metal _B	Metal _C	Metal _D						
	Mineral _i	Mineral _B	Mineral _C	Mineral _D						
	Land _i	Land _B	Land _C	Land _D						

Economic reference indicator

- GDP as the classic
- But we need a 'quality of life' indicator too
 - Adjusted net savings
 - ISWE
 - GPI

(all corrections on GDP instead of measuring QoL)

 - Better life index (not integrated)
- Our preferences:
 - Human Development Index
 - Happy life years index

Intermezzo: constructing HDI

- Life expectancy at birth – normalized from 0-1 for 20-85 years
- Knowledge - normalized from 0-1 for 0 to 18 years of schooling
- Living standard: normalised from 0-1 for 100\$ to 75.000 \$ /year
- Multiply the 3 normalised indices.....take the cube root
- PRESTO – we have the HDI

Proposal Resource 1: Carbon

- GWP is already for decades the default indicator to aggregate carbon emissions
- The real question is if the carbon footprint should be included in a Resource index of nations, since it represents an impact rather than resource extraction
- So: high consensus on the indicator, low consensus if it should be included

Proposal Resource 2: Water

- Exclude Green (rain) water: natural vegetation also has evapotranspiration
- Exclude Grey water: that is an impact, not a resource extraction
- Include Blue (river, aquifers) water, but correct for the water stress in the catchment area where extraction takes place.
 - Withdrawal ratio $< 20\%$: no stress
 - Withdrawal ratio $> 40\%$: severe stress
- This in essence proposes the Water stress index proposed by Pfister et al. (2009) => reasonable consensus
- Note: in the GRFoN we followed the convention of the Water footprint network and just counted m³ water extracted

Proposal Resource 3: Land

- Low consensus on the best approach (but maybe the LC Impact session solved this ;-))
 - Land use occupation in $m2^*$ time span
 - Idem but correcting for (changes in) land productivity or quality (e.g. EF, HANPP)
 - Idem but trying to assess things in terms of biodiversity loss (PDF, MSA), etc.....
 - ...plus suggestions for including a time dimension for restoring the system to a natural state
- Host of other complicating factors
- In sum, methods are available but consensus is low

Proposal Resource 4: Materials

- Various methods
 - Simply adding up by weight as in ewMFA – which over-emphasises non critical materials with low impacts
 - Aggregating on the basis of life cycle impacts (EMC, v.d. Voet et al. 2005)
 - Aggregating on the basis of scarcity or criticality
 - Based on reserves
 - Based on energy or exergy use)

Methods for weighing across resources

- One-issue methods (e.g. express everything in one parameter such as land use (EF), carbon emissions (CF), monetary units (external costs))
- Methods with implicit weighting (e.g. Distance to target; Prevention costs to reach a specific target)
- Explicit weighting of midpoints or end points
 - Existing panel values
 - New panel values

Suggestion to WRF for a first exercise

- Keep it simple: use one of the existing MR EE IO databases (WIOD, EORA, EXIOBASE) to calculate footprints, or maybe all of them
- Use the following ways of aggregation within resource categories:
 - Water: Pfister et al., 2009
 - Land: t.b.a. (use pragmatically an LCIA method well accepted)
 - Materials: t.b.a.(use pragmatically an LCIA method well accepted)
- Use explicit weighting
 - Existing panel values
 - New panel values
 - ...or worst case, copy the HDI weighting method (which would require normalisation on minimal and maximum footprints per capita, which is a discussion in itself)
